

Plant protection from Corteva Agriscience™ in cereal crops

Author(s): Растителна защита
Date: 15.02.2021 Issue: 2/2021

For another consecutive year, **Corteva Agriscience™** will provide comprehensive solutions for agriculture, including unmatched hybrids with high yield potential, as well as crop protection products that will give you peace of mind about your crops. Allow us to present our solutions for clean and healthy stands in cereal crops:

Derby® Super One / Lancelot® – a herbicide that effectively controls economically important annual and perennial broadleaf weeds. It is registered for use in cereal crops – wheat and barley, and as of this year it is also registered in maize for grain and silage. It stops the growth and development of susceptible weeds within one day after treatment. Low temperatures down to 5 °C and temperature fluctuations do not affect its performance.

Palas® 75 WG – a herbicide for simultaneous control of grass and broadleaf weeds in wheat. It is a proven benchmark for the control of *wild oat* and brome grasses in Bulgaria. The product can be applied from the 3rd leaf stage to the second node stage. There are no crop rotation restrictions for subsequent crops, including legumes.

Corello® Duo 85 WG is the broadest-spectrum herbicide for the control of grass and broadleaf weeds in wheat, triticale and rye. It is not affected by low temperatures and large temperature amplitudes, and is selective to the crop when applied after the second leaf. It is effective against volunteer sunflower and oilseed rape. **Corello® Duo** is uncompromising against *meadow brome* and *wild oat*.

Starane® Gold is a post-emergence herbicide for the control of broadleaf weeds. It is a benchmark against *cleavers* and *bindweed*. The herbicide contains the active substances *fluroxypyr* and *florasulam*. **Starane®** is selective to wheat, rye, oats, barley and triticale. It is applied from the second leaf to stem elongation of the crop, in autumn or spring.

Mustang® – a selective systemic herbicide for the control of broadleaf weeds in wheat and barley, including those resistant to hormone-like herbicides. For spring treatment of cereal crops it can be used until the end of the tillering stage. **Mustang®** can be tank-mixed with fungicides, grass herbicides, foliar fertilizers and insecticides.

For the control of all economically important diseases in cereal crops, we offer the well-known fungicide **Alegro®**. It is a fungicide from the **AgCelence®** concept of **BASF**. The combination of a strobilurin with one of the strongest triazoles – epoxiconazole, in terms of rusts and septoria species, provides extended protection against these diseases. **Alegro®** will be offered for the last year and will be more cost-effective than analogous fungicides. In 2021, look for the better price with the package offer **Derby® Super One + Alegro®**! This package will provide flawless control of weeds and diseases in cereal crops.
