АксиалЕдно **syngenta.**

Axial One is a two-component product – a combination of a.s. pinoxaden and a.s. florasulam, with an application rate of 100 ml/da. As a result of the excellent synergy between the two active substances and, at the same time, their different modes of action, **Axial One** has exceptionally high efficacy against the most important grass weeds such as: ryegrass, wild oats, brome grass, foxtail and a large part of the broadleaf weeds, including field bindweed, cleavers, and wild poppy. The product contains a built-in adjuvant, which allows its faster penetration into the weeds and, accordingly, stops their growth and development within 48 hours. The product is extremely suitable for solving situations where mixed weed infestation is a problem. The integrated control and the broad spectrum of controlled weeds, both grass and broadleaf, make **Axial One** one of the most suitable products for dealing with difficult situations in the field.

The wide application window is another key advantage of **Axial One**. The product can be applied up to the second node stage of the crop, which makes it suitable for both autumn and spring application. The high selectivity to the crop is due to the fact that the product contains a built-in safener, which eliminates the possibility of causing phytotoxicity.

Axial One from Syngenta – a comprehensive solution in the control of grass and broadleaf weeds. From this season you can purchase **Axial One** at a significantly better price! For more information, please contact the respective regional representative.
