Аксиал Едно® **syngenta.**

Axial One is a two-component product – a combination of the active substance pinoxaden and the active substance florasulam, with an application rate of 100 ml/da. As a result of the excellent synergy between the two active substances and at the same time their different mode of action, Axial One provides exceptionally high efficacy against the most important grass weeds such as: ryegrass, wild oats, brome grass, foxtail and a large part of the broadleaf weeds, including Canada thistle, cleavers, field poppy. The product contains a built-in adjuvant, which enables its faster penetration into the weeds and, accordingly, the cessation of their growth and development within 48 hours. The product is extremely suitable for resolving situations where there is a problem with mixed weed infestation.

Another key advantage of Axial One is that it has a wide application window, namely up to the second node stage of the crop, which makes it suitable for both autumn and spring application. The high selectivity to the crop is due to the fact that the product contains a built-in antidote, which eliminates the risk of phytotoxicity.

Axial One from Syngenta – a comprehensive solution for the control of grass and broadleaf weeds. From this season you can purchase Axial One in a package with Amistar Prime at a significantly better price!
