

Tradition and innovation in one package

Author(s): Corteva Agriscience™

Date: 01.02.2023 Issue: 2/2023

In 2023, look for the package offer combining the tradition of the proven herbicide for broadleaf weed control – **Derby® Super One** in combination with one of the two new fungicides **Univoq®** or **Inovor®***. These packages will provide you with impeccable control of all important broadleaf weeds and the most economically significant diseases in cereal crops.

Derby® Super One /Lancelot® – a herbicide that effectively controls annual and perennial broadleaf weeds. It is registered for use in cereal crops – wheat and barley, and for a second year in maize for grain and silage.

It stops the growth and development of susceptible weeds within one day after treatment.

Low temperatures down to 5°C and temperature amplitudes do not affect its performance.

Derby® Super One/Lancelot® is a post-emergence herbicide that penetrates the weeds through the vegetative parts and is then translocated throughout the entire plant. Another advantage of **Derby® Super One/Lancelot®** is that it stops the growth of secondary emerging weeds 2–3 weeks after treatment.

It is selective to the crop when applied after the second leaf stage. It is effective against cleavers, even in advanced stages, ephemeral weeds including speedwell and violet, and against volunteer herbicide-tolerant sunflower, as well as volunteer herbicide-tolerant oilseed rape.

For control of all economically important diseases in cereal crops, we offer you the new fungicide for cereals **Inovor®***. It is a combination of pyraclostrobin and fluxapyroxad and has long-lasting preventive action, protecting against pathogen penetration; stopping action, which destroys already developed spores; and curative action, which blocks the development of fungal pathogens and stops the growth of hyphae.

Inovor™ performs impeccably against *Septoria* spp., rusts, net blotch, leaf blotch, *Drechslera*, and powdery mildew, with the recommended application rates being – T1 – 75 ml/da and T2 – 90 ml/da.

Our second package offer with **Derby® Super One** is with the new fungicide of Corteva Agriscience – **Univoq®**, which provides outstanding preventive, stopping and curative action against all important diseases in cereal crops.

Univoq® is a two-component fungicide containing prothioconazole, which is one of the newest triazoles, with systemic, curative and preventive action, and the completely new active substance Inatreq™ active from a new chemical group with a new mode of action against a broad spectrum of diseases. Its most significant advantage is that it is the new benchmark against *Septoria* spp. and a tool in the management of resistance to this pathogen.

Univoq® is applied at a flexible rate depending on the timing of application, as follows: T1 – 120 ml/da; T2 – 130 ml/da and T3 for *Fusarium* protection at a rate of 130 to 150 ml/da.

Dear farmers, rely on the package offers combining the herbicide **Derby® Super One** and one of the two fungicides **Univoq®** or **Inovor™*** for reliable and efficient protection of your cereal crops from problematic broadleaf weeds and diseases, and at a perfect price!

**Inovor® is a product and a registered trademark of BASF, distributed by Corteva Agriscience™*
