

Квелекс® - My farm, our future!

Author(s): Corteva Agriscience™

Date: 01.03.2023 *Issue:* 3/2023

After more than 20 years, Corteva agriscience™ presents to you a new herbicide, with a new active substance and a new mode of action in cereal crops.

For many years, the market has been dominated and supplied mainly with herbicides against broadleaf weeds based on active substances from the sulfonylurea group. This inevitably led to the development of resistance to these herbicides, which belong to one chemical group and have the same mode of action.

We can confidently state that this problem is now in the past.

Quelex® is a new stage in weed control – it controls all weeds, including those resistant to sulfonylurea and hormone-like herbicides due to the content of Arylex™ Active.

The herbicide Quelex® is a TRULY new solution for the control of broadleaf weeds, even those resistant to other active substances (sulfonylureas and hormone-like) such as cleavers (Galium aparine), corn poppy (Papaver

rhoeas), cornflower (*Centaurea cyanus*) and fumitory (*Fumaria officinalis*).

Arylex™ Active is a new active substance, from a new chemical group, with a completely different mode of action.
