ВИКСЕРАН® — доставя азот по естествен и устойчив начин на културните растения

**Виксеран** syngenta.

In recent years, agriculture in Europe, and in particular in Bulgaria, has been undergoing a series of challenges and changes.

- regulatory changes and new requirements for optimising fertiliser application rates, the implementation of the so-called Green Deal in Europe
- the challenge of climate – key resources such as water are becoming increasingly limited
- the economic situation on a global scale

Syngenta is one of the leading companies worldwide, which actively develops solutions in line with the new requirements/trends of the market.

We are convinced that the solutions we provide to farmers all over the world ensure the development of their farms and their production.

Nitrogen fertilisation is of key importance for increasing yield and product quality, but we are increasingly speaking about precision fertilisation or the efficient / optimal use of nutrients and water.

Precision fertilisation is crucial on the one hand for fertiliser rates to be maximally utilised by the plants, without the risk of negative consequences, and on the other for the impact on the environment to be reduced.

This year we have the opportunity to present VIXERAN.

VIXERAN is a product that is fully applicable in accordance with the new trends for optimising fertiliser rates and achieving more sustainable production.

VIXERAN has the ability to fix nitrogen from the atmosphere and the soil, supplying it to the cultivated plants.

Numerous trials and studies in field crops, including those conducted in Bulgaria, prove that VIXERAN allows a reduction of fertiliser rate by up to 30–40 kg/ha of active substance, while compensating the amount of nitrogen required by the crop and maintaining yield potential.

More information about VIXERAN can be found here:
