

Магнело – the new proposal from FMC for protecting wheat from diseases

Author(s): ФМС АГРО БЪЛГАРИЯ

Date: 11.03.2024 *Issue:* 3/2024

In 2024, FMC introduced the fungicide Magnelo to the Bulgarian market for reliable control of major diseases in wheat.

The difenoconazole contained in Magnelo has preventive and curative effect, while tebuconazole provides long-lasting protection of the crop against diseases.

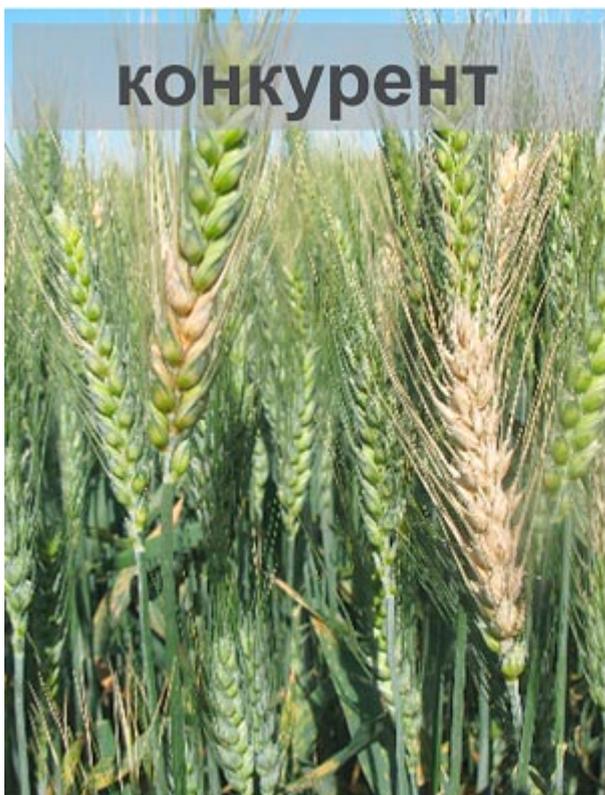

The combination of the two active substances at the full required dose for disease control ensures higher yield and preserves the quality of the produce.

The diseases controlled by Magnelo are among the most significant and harmful wheat diseases:

Timely treatment with a fungicide at the onset of each of these diseases is a factor of great importance for the protection of the crop and the yield.

Magnelo demonstrates excellent efficacy against fusarium

Thanks to Magnelo you obtain:

- Preservation of yield and quality of the harvest (control of mycotoxin accumulation)
- Protection against stem, leaf and ear diseases (over 20% of the yield depends on the ear)
- The full required dose of active substances for control of severe diseases such as fusarium
- Very fast absorption (up to 1 hour)
- Excellent penetration and translocation, double systemic action
- Preventive, curative and eradicated action
- Long-lasting protection of wheat

Magnelo is applied from flag leaf stage to the end of flowering stage (BBCH 39-69) at a dose of 100 ml/da.
