Since its market debut in 2022, the herbicide Quelex® by Corteva Agriscience™ has quickly gained the trust of farmers in Bulgaria. The product has proven its efficacy in the control of broadleaf weeds in cereal crops, providing excellent results and easy application. Many farmers have already included it in their crop protection programmes and have shared positive feedback about its performance.

Quelex® is distinguished by its high flexibility of application – it can be used both in the autumn and in the spring. The recommended rate is 5 g/ha, and the treatment can be carried out from the first leaf stage up to the flag leaf stage of the cereal crops. This wide time window gives you the freedom to adapt the treatment with Quelex® according to field conditions and the growth stage of the weeds.

One of the major advantages of Quelex® is its rapid action. Only a few hours after application, the first symptoms of wilting and deformation of the weeds can be observed. Their complete destruction occurs within 2 to 4 weeks, during which time the weeds are not competitive to the crop.

Farmers have also appreciated the possibility of tank-mixing Quelex® with other herbicides and fungicides, which optimises the work process and facilitates the control of broadleaf and grass weeds. Particularly effective is the combination with PALAS 75 WG® for full weed control.

The exceptional selectivity of Quelex® is another factor that inspires farmers' confidence – a built-in safener ensures crop protection even under unfavourable conditions. The product works within a wide temperature range – from +5°C to +27°C, which makes it ideal for application under variable climatic conditions.

With the experience accumulated from the first years of use, Quelex® is strengthening its reputation as a reliable and effective partner for farmers in the fight against broadleaf weeds.
