ПЕТ активни вещества
за ПЪЛЕН контрол на
на най-важните **ЖИТНИ**
и **ШИРОКОЛИСТНИ** плевели
в **ПШЕНИЦА!**

NEW Package offer from FMC Agro Bulgaria for complete control of economically important grass and broadleaf weeds in wheat.

Modern wheat production requires effective and flexible solutions for weed control, especially when there is a mixed background of grass and broadleaf weeds. In response to these challenges, **FMC Agro Bulgaria** offers **Ateviator™ Pro Package** - a technological package offer, developed for reliable and sustainable control of the most economically important weeds in wheat.

Atevior™ Pro Package combines two systemic herbicides - Atevior™ and Cerventa®, with a total of 5 active substances included in the package, ensuring a broad spectrum of action and reliable control of sensitive weeds, as well as the adjuvant Biopower®, and the product Atevior™ contains an antidote - mefenpyr-diethyl, guaranteeing high selectivity to the crop.

Atevior™ contains the active substances mesosulfuron-methyl and thienencarbazone-methyl, which are absorbed both through the leaves and through the root system of weed plants. The combination provides systemic action and effective control of sensitive weeds, stopping their growth and leading to gradual death.

Cerventa® complements the package with the active substances tribenuron-methyl, metsulfuron-methyl, and florasulam, which expand the spectrum of action and increase efficacy against a number of problematic broadleaf weeds. The systemic action of the product ensures rapid absorption and a visible effect within 1-2 weeks after treatment.

Thanks to the combination of 5 active substances, **Atevior™ Pro Package** provides reliable control of a wide range of grass and broadleaf weeds, including:

- Grass weeds such as **brome, fescue, foxtail, windgrass, wild oat**
- Broadleaf weeds such as **cleavers, chamomile, thistle, scentless mayweed, wild poppy, bindweed, speedwell, black nightshade**, as well as other economically important species

Atevior™ Pro Package is applied to wheat at the stage from the beginning of tillering to the second node (**BBCH 21–32**). The active substances in the package are selected to ensure high efficacy against weeds and excellent selectivity for the crop.

The package offer from **FMC Agro Bulgaria** facilitates the planning and implementation of plant protection practices by farmers, offering:

- a professional technological approach
- an expanded spectrum of controlled weeds
- high reliability in difficult climatic conditions

Atevior™ Pro Package is developed as a practical and effective solution for farmers who seek security, flexibility, and sustainable weed control in wheat.

With Atevior™ Pro Package from FMC Agro Bulgaria – more security in control and a stable start for the crop.

Expect 2026!
