

Verben® – bet on safety in the fight against rot species in cereal crops

Author(s): Corteva Agriscience™

Date: 12.02.2026 Issue: 2/2026

The fungicide **Verben®** from Corteva Agriscience is a highly effective solution for protecting cereal crops, providing exceptional control over economically significant diseases, including various **types of rot** – a problem that often leads to serious yield losses.

Mode of Action – Dual Power, Maximum Security

Verben® combines **two active substances** with completely different modes of action – **Proquinazid** and **Prothioconazole**. This synergy guarantees both prevention and strong curative action in the presence of infection.

Vapor Phase – The Key to Rot Control

Proquinazid is an active substance with a proven **vapor phase**, meaning that after application the product:

- **Protects even the untreated parts** of the plants
- Stops the rapid spread of the pathogen
- Reactivates after rainfall, ensuring long-lasting action

This characteristic is particularly important in the fight against **root rots and fusarium**, where quickly limiting the infection is critical.

Enhanced Immune Resistance

Proquinazid also has a **physiological effect**, supporting the plant's natural defense mechanisms – an advantage that allows the crop to overcome stress factors and recover more quickly.

Practical Advantages That Make the Difference

- **Preventive, Stopping, and Curative Action**

Verben® is a reliable choice both for early symptoms and for already visible disease development.

- **High Rainfastness**

Thanks to rapid drying and excellent formulation, the product is resistant to variable weather.

- **Depot Formation**

The waxy cuticle creates a **reservoir of active substance**, ensuring prolonged and uniform action.

Controlled Diseases

Verben® provides excellent protection against:

- Types of rot in cereal crops
- Powdery mildew
- Septoria leaf and glume blotch
- Brown and yellow rust
- Leaf spots (Drechslera)
- Net blotch
- Ramularia

- Fusarium head blight

Application Timing and Recommended Dosages

Dosage flexibility allows adaptation to different crop stages and disease pressure:

- **T1:** 60 ml/decare
- **T2:** 75 ml/decare
- **T3:** 90 ml/decare

Verben® is compatible with herbicides and insecticides and is suitable for inclusion in comprehensive plant protection programs.

Conclusion

Verben® is the reliable partner for farmers in the fight against the most important diseases in cereal crops. With a fully innovative formulation, vapor phase, proven efficacy against rots, and long-lasting protection, the product guarantees peace of mind, security, and maximum yield potential.
