During the period, the meteorological conditions are very favorable for the development and spread of diseases and pests in fruit crops and vineyards.

The active growth of the fruits continues and their ripening begins. To protect the fruit and grape harvest, it is necessary to continue regular inspections and surveys of the crops in order to determine the degree of disease development and pest density and to successfully carry out control measures against them.

Fruit crops - main pests for the period

Coddling moth

Plum fruit moth

Oriental fruit moth

Cherry fruit fly

Aphids

Leaf-mining moths on fruit species

Other pests of fruit species
