

Ариго™ WG – the new comprehensive solution from DuPont for weed control in maize

Author(s): Дюпон

Date: 27.04.2017 Issue: 4/2017

ДюПон™ Ариго™ ВГ	КОНТРОЛА	Цялостно решение за контрол на плевелите при царевица при отлична селективност и само едно третиране.
	 <p>26 дни след третиране</p>	

Arrigo™ WG is a new broad-spectrum herbicide that provides complete control of grass and broadleaf weeds in maize with a single treatment. Arrigo™ WG is a reliable, safe and flexible herbicide with a wide application window.

Arrigo™ WG is a homogeneous water-dispersible granule formulation (WG).

Arrigo™ WG is a powerful combination of three active substances – nicosulfuron, rimsulfuron and mesotrione. The product is applied at a rate of 33 g/da with 0.1% Trend® 90 adjuvant from the 2nd to the 8th leaf stage of maize.

In a number of trials conducted both in Bulgaria and in other European countries, Arrigo™ WG has proven to be a powerful new solution, combining in a new formulation two of the leading products for grass weed control with an excellent broadleaf herbicide with soil activity, creating a new standard in weed control in maize.

Arrigo™ WG represents the correct balance between nicosulfuron, rimsulfuron and mesotrione. Arrigo™ WG is selective to the crop, without restrictions regarding subsequent crops in the crop rotation, and is independent of different soil types and temperature. With the combination of active substances with different modes of action, Arrigo™ WG is an excellent tool for preventing the development of resistance.
