Last week, a new, modern, multifunctional facility opened its doors in the Rechitsa district of Sliven. The realization of this project is another indication of the management team's ability to accomplish things in the best possible way.

The Viola Agrocentre, a truly modern logistics base, was opened in a manner that speaks of its own style and class. Only the people directly involved in the realization of this technological format were present here – the company's team, the builders, the supervisory authority, and the bank that financed the project.

The profile of the facility, located on 500 sq.m, includes several focal points – separate halls for different types of pesticides – herbicides, insecticides, fungicides, as well as for fertilizers and seeds. The complex also "features" an agro-pharmacy with a separate warehouse, a conference hall, an administrative block with adjacent auxiliary

and service departments. The Agrocentre is equipped with modern machinery for mechanizing loading and unloading operations, and the necessary conditions to guarantee temperature and hygiene standards are provided.

The Agrocentre was opened by the managing managers Albena Vavova and Temenuga Ivanova. In her address to those present at the ceremony, Ms. Vavova stated: *"On the eve of the 25th anniversary of the company's founding, our dream of having our own Agrocentre has come true! Many people worked hard to turn this project into reality. Most of the main "culprits" for this building being here today are present. Thank you all for the energy, commitment, and emotions."* This is something very special, noted Dr. Elena Mancheva, the company's founder, on this occasion. She clarified: "When you do something and have proof that you are doing it well, you want to get more proof that you are doing well, i.e., you want to grow."

You can find more photos from the opening of the Viola Agrocentre in the gallery below the article.
